Brief portfolio Romane HUGI

For my wireframe, I want a One page. Because I want a simple visual application for smartphone.

I begin with my name and my first name, then my future professional status.

In second part, I indicate my age and my location with a little description of my person and my school.

There is the possibility to download my CV and visit my Github with button. I think I'm going to animate the buttons with JS.

We continue with my developer skill, with technologies seen at the moment.

My portfolio ! I put different insights of my projects. A little icon of magnifying glass for open in a modal the description, photo, date and title of the project.

A contact form is here for… contact me ! If the visitor wish it. The contact form will be in PHP.

Same for button animation.

And for the end, my social networks, accessible from clickable icon.

I choose Vue JS for my project.

My portfolio is an simple one page. I want to choose Vue JS because it is intuitive, and combine the best parts of React JS and Angular 2.

Vue JS is an easy to use Framework, he has a good documentation, simple, complete, effective and flexible !

He have a virtual DOM like React. This DOM increases the reactivity with a unbeatable performance.

The thing which attracts me in this framework for my mobile application is really his « easy to learn » and intuitive peculiarity wich will allow me to diving in my project with some days to learn how to use it.

I don't want that misunderstanding of a framework me brakes in my project.

Angular JS 2 and React are also very interesting but I would use them in my future other project.
I want a simple, clear and efficient framework and Vue JS looks like my expectations.
